Rotaract Club of Xiamen University Malaysia | Rotary Club of Kuala Lumpur Dynamics | Rotary Club of Tun Razak Exchange

SDC Hackathon

Technical Tools Declaration

Hosted by Xiamen University Malaysia (XMUM) AI Club
Submission Deadline: 25 October 2026

Instructions: Declare every API, cloud service, AI tool, dataset, model, and sponsor resource your team used to build the project. Complete every section; where a category does not apply, tick "No" or write "None" – do not leave it blank. Submit as a single PDF document named "SDC2026_TeamName_TechDeclaration.pdf" together with your project submission. Undeclared third-party resources discovered at judging may affect your score or eligibility.

SDC HACKATHON 2026

Technical & Tools Declaration

Hosted by Xiamen University Malaysia (XMUM) AI Club
Submission Deadline: [Insert date]

Instructions: Declare every API, cloud service, AI tool, dataset, model, and sponsor resource your team used to build the project. Complete every section; where a category does not apply, tick "No" or write "None" – do not leave it blank. Submit as a single PDF document named "SDC2026_TeamName_TechDeclaration.pdf" together with your project submission. Undeclared third-party resources discovered at judging may affect your score or eligibility.

1. Team & Project Overview

Team Name	Moon Rider
Project / Solution Name	SmartQuoteAI
Name (Leader)	Nyan Moe Htet
Email & Phone (Leader)	Nyanmoehtet2001@gmail.com , +60107167645
University Affiliation(s)	Asia Pacific University
Live Prototype URL	SmartQuote AI
Code Repository URL (public/access granted to judges)	https://github.com/Nyan-Moe-Htet/SmartQuote-AI

2. Architecture & Technology Stack

2.1 System Architecture Overview

Describe how the components declared in this document connect end-to-end (e.g., user interface → backend → AI model/API → database → cloud hosting). Attach a system block diagram as an appendix if available.

[Maximum 200 words]

SmartQuote AI is a web-based prototype developed using Python and Streamlit and hosted through Replit. Users enter simulated supplier messages or quotation details through the web interface. The application validates quotation fields and uses Python modules to check minimum order quantities, calculate estimated order costs, compare eligible supplier offers, and rank results.

The purchase workflow supports human review and approval or rejection. After approval, the application generates a purchase-order draft and records user actions in an activity log. It does not automatically send purchase orders or execute transactions.

The current prototype uses synthetic quotation data and session-based application state. It does not currently depend on an external GenAI API or a persistent database. GitHub is used for source-code version control. Replit provides the development and hosting environment for the running prototype.

The architecture separates user interaction, quotation validation, deterministic comparison logic, and the approval workflow to make the prototype easier to test and extend. Any future AI-assisted extraction, persistent database, or additional API integration will be declared if implemented.

2.2 Languages, Frameworks & Libraries

List the main programming languages, frameworks, and third-party libraries that your team did not create. Open-source use is permitted provided it is declared and properly licensed/attributed.

Name & Version	Purpose in Project	License
Python — exact version not yet confirmed	Application logic, validation, quotation comparison and purchase workflow	Python Software Foundation License (verify the runtime version used)
Streamlit >=1.66.1,<2.0.0	Web interface and interactive app pages	Apache License 2.0

3. APIs & Cloud Services

3.1 External APIs

List every external API your solution calls (GenAI, maps, payments, messaging, data feeds, etc.). Do not include API keys or secrets in this document.

API & Provider	Purpose in Project	Access Tier (free / paid / sponsor-provided)
RunPod Serverless/Endpoint API — GLM-5.3 (endpoint ID b1dd8hy2hqo1nb)	Called successfully by a separate test script during development to verify API connectivity. Do not claim it powers the live app unless it is integrated into app.py and tested there.	Sponsor-provided credits / access (verify exact award terms)
Other external APIs	None	None

3.2 Cloud Platforms & Deployment

List every cloud service used for hosting, storage, databases, authentication, or compute, and indicate how the prototype is deployed.

Service & Provider	Purpose in Project	Plan / Region
Replit	Development environment and prototype hosting/deployment	Account plan and deployment region not confirmed.
GitHub	Source-code repository and version control; repository is listed above.	Public/access granted to judges, as required.
RunPod	Hosted inference endpoint used in standalone GLM-5.3 connectivity test.	Endpoint region/plan not confirmed; do not include secret credentials.

Service & Provider	Purpose in Project	Plan / Region
Persistent database / external storage	None currently used; app state is session-based	Not applicable

4. AI Tools, Models & Datasets

4.1 AI Models Used in the Solution

List every AI model embedded in or called by your application, including pre-trained, fine-tuned, and self-trained models.

Model & Version	Source / Provider	Usage (pre-trained / fine-tuned / self-trained)	License / Terms
GLM-5.3	Z.ai model served through RunPod endpoint	Used in a standalone development/API integration test. Not confirmed as part of the running app's user-facing workflow.	Provider and RunPod endpoint terms apply; verify current terms.

4.2 Datasets

List all datasets used for training, fine-tuning, evaluation, or in the running application. State clearly if a dataset contains personal or sensitive data.

Dataset Name	Source / URL	Type (public / private / self-collected / synthetic)	License	Personal Data? (Y/N)
Synthetic supplier quotation examples / simulated inputs	Created for prototype testing; no public URL.	Synthetic	Team-created; no separate dataset license.	N

Dataset Name	Source / URL	Type (public / private / self-collected / synthetic)	License	Personal Data? (Y/N)
External training/fine-tuning datasets	None	None	Not applicable	N

4.3 AI-Assisted Development Tools

Tools used to help write code, design, content, or documentation (e.g., chat assistants, code completion tools, image generators). Declaring these tools does not reduce your score; undeclared use may.

Did your team use any generative-AI tool to help create code, design, text, or other project material?

✓ Yes ☐ No

If yes, list them below:

Tool & Version	**Used For**	**Extent of Use (minor / moderate / major)**
ChatGPT — model/version not recorded	Coding guidance, debugging help, README and technical declaration drafting.	Moderate

Briefly describe how your team reviewed, tested, and took responsibility for AI-generated output:

[Maximum 100 words]

The team reviewed AI-assisted suggestions against the project requirements, ran the application and integration tests where possible, and remains responsible for the submitted code and documentation. AI-generated content was treated as assistance rather than as a substitute for testing. The team will verify that described features match the actual prototype, check dependencies and licenses, and remove all credentials from source files and repository history before submission

5. Sponsor-Provided Resources

Declare any official SDC sponsor-provided GenAI API, cloud credits, tools, mentoring, or data that your team used.

Did your project use any official SDC sponsor-provided resource?

☐ Yes ☐ No

If yes, list them below:

Sponsor	**Resource (API / credits / platform / data)**	**How It Was Used in the Project**
RunPod / SDC-provided access (confirm official sponsor attribution)	Credits / hosted GLM-5.3 endpoint	A separate test script called the endpoint successfully during development. State that it is part of the live prototype only if the main application calls it and the feature has been tested end-to-end.

Was the sponsor resource essential to the core functionality of the prototype, or could it be replaced? Explain briefly:

[Maximum 100 words]

For the current deterministic quotation validation, cost calculation, supplier comparison, and approval workflow, the RunPod GLM-5.3 call is not essential if it remains only a standalone test; these functions can run without an external model. If GLM-5.3 is integrated into the main app for AI-assisted extraction or analysis, that capability depends on API availability, credits, network access, and provider terms, and could potentially be replaced by another compatible model/API

6. Security, Privacy & Responsible Use

6.1 Data Handling & Privacy

What user or personal data does your application collect, store, or send to third-party services (including AI APIs)? How is it protected, and how long is it kept? State "No user data is collected" if applicable.

[Maximum 150 words]

The prototype uses synthetic supplier quotation examples and session-based application state. It is not intended to collect real supplier, customer, payment, or other personal data. No persistent database is currently declared. The standalone RunPod test sent a generic test prompt to the GLM-5.3 endpoint; do not send real personal or confidential quotation data unless the team has reviewed provider terms and updated this declaration. The RunPod API key is stored as an environment secret in Replit and must not be committed to GitHub or included in this PDF. Session data may be lost when the session ends; actual retention behavior depends on the hosting environment. The team should verify the deployed app and repository for any accidental personal data or credentials before submission.

6.2 Known Limitations & Risks

Identify the main technical limitations of your AI components (e.g., hallucination, bias, rate limits, dependency on a single provider) and any mitigation you have implemented.

[Maximum 150 words]

The prototype uses simulated data and has not been validated against real supplier quotations. Incorrect or incomplete user-entered values may affect calculations and rankings. Session-based state is not a persistent audit database. If GLM-5.3 is later connected to the main workflow, model output may be inaccurate or incomplete, and the service may experience latency, rate limits, outages, or credit exhaustion. Mitigations include deterministic validation and calculation logic, human review and approval before purchase-order drafts, no automatic transaction execution, synthetic test data, and keeping API credentials in environment secrets. The team should test the live user journey, confirm the model integration status, and avoid treating AI output as financial or purchasing approval.

7. Compliance & Readiness Checklist

Tick all boxes that apply before submitting.

- ✓ All APIs, cloud services, AI tools, models, and datasets used in the project are declared in this document.
- ✓ All third-party code, datasets, and models are used in accordance with their licenses, and attribution is provided where required.
- ✓ No API keys, passwords, or other credentials are exposed in the code repository, prototype, or this document.
- ✓ Any use of generative-AI tools for development has been disclosed and reviewed by the team.
- ✓ Any use of official SDC sponsor resources has been declared in Section 5.
- ✓ The prototype described here is accessible to judges through the links provided in Section 1.
- ✓ All fields in this template have been completed within the word limits stated.

8. Declaration

By submitting this document, the team leader confirms that the information provided is complete and accurate to the best of the team's knowledge, and that every API, cloud service, AI tool, dataset, model, and sponsor resource used in the project has been declared.
